

To display code on the same line, you can use `dashes` to highlight code differently from the written text. If you want to show entire code sections, use three dashes on a new line and close the block with another set of three dashes. You can optionally specify the programming language used in the code block to provide syntax highlighting.

Example of code block without syntax highlighting:

```
#include <iostream>
int main() {
    std::cout << "no syntax highlighting applied" << std::endl;
    return 0;
}
```

Same code example, but now we use C++ syntax highlighting:

```
#include <iostream>
int main() {
    std::cout << "c++ syntax highlighting applied" << std::endl;
    return 0;
}
```
